### **🧪 Research Interests**

---

As part of my commitment to advancing the fields of structural biology and medicine, I am interested in pursuing a potential thesis in time-resolved structural biology using x-ray crystallography and time-resolved cryogenic tomography. My aim is to develop a more comprehensive understanding of the dynamics of protein structures, particularly in response to ligand binding and enzymatic reactions, which can inform the design of more effective therapeutics.

Additionally, I am intrigued by the study of organelles and their roles in cellular function and disease. I am excited about the potential of developing novel microscope technology that integrates nanofluidics to enable high-resolution imaging of organelles in live cells. This research can potentially contribute to developing new diagnostic and therapeutic approaches for diseases such as cancer, neurodegenerative disorders, and infectious diseases.

Overall, my research interests and goals center on using cutting-edge techniques in structural biology and medicine to develop novel therapies for various diseases and contribute to advancing the fields of biology, biochemistry, microbiology, and immunology through disseminating our findings.
